CHIN HIN™
ECOSYSTEM OF EXCELLENCE

Powered by: Microsoft KABEL

CHIN HIN AI HACKATHON 2026

DIGITAL ACCELERATION PROGRAM - ENTERPRISE (DXP-E)

PROGRAM TIMELINE

Week 1: Problem Discovery + Requirement Gathering

Deliverable: Problem Statement & User Requirement Report

17 – 23 Jan

PRESENTATION

26 – 30 Jan

Week 2: Solution Ideation & Design

Deliverable: Solution Architecture Design Report

Week 3: MVP Development – Core Build in Microsoft Foundry

Deliverable: MVP in Staging

02 – 06 Feb

09 – 13 Feb

Week 4: MVP Development – Core Build in Microsoft Foundry

Deliverable: MVP in Staging

CNY BREAK

Week 5: MVP Development – UI/UX & Integration

Deliverable: Live MVP

23 – 27 Feb

02 – 06 Mar

Week 6: Testing, Documentation & Final Pitch

Deliverable: Project Submission

FINAL (TBA)

BUSINESS CHALLENGE 1

Your Mission is to Build the Ultimate CRM AI Recommender for Synergy Team

Owner: Marvis

Synergy

#Business Application

Problem Statement	How might we develop an intelligent agent that analyzes incoming project leads to automatically identify and prioritize high-value cross-selling opportunities?		
Description	Chin Hin offers thousands of products across multiple divisions, but manually matching a new project's specifications to the right mix of our solutions is slow and complex. When a new project lead arrives, the Synergy Team needs an AI agent that can instantly analyze the project requirements, search our entire product catalog, and recommend a comprehensive "Chin Hin Bundle" or route specific needs to the relevant Business Units.		
Pain Point	• **Information Overload:** With thousands of SKUs, it is impossible for sales agents to manually recall every matching product or supplier solution for a complex project.	• **Missed Bundling Opportunities:** We often sell single products (e.g., just cement) while missing the chance to package complementary solutions (e.g., mesh, sanitary ware, roofing).	• **Slow Response Time:** Manually dissecting project specs to find the right internal Business Unit (BU) creates delays in quotation and engagement.
Expected Outcome	✓ **Intelligent Requirement Analysis:** An AI agent that scans project lead (Specs) to extract key material and solution needs automatically.	✓ **Automated Product Matching:** A logic engine that cross-references project needs against our master product database to suggest specific SKUs and supplier solutions.	✓ **Smart Routing & Bundling:** A system that proposes "Best-Fit Bundles" for the Synergy Team and auto-routes leads to the correct BU for rapid execution.
Why This Matters	This transforms us from a "product seller" to an "**integrated solution provider**." By automating the connection between project needs and our product ecosystem, we maximize the commercial value of every lead and dramatically reduce time-to-quote.		

BUSINESS CHALLENGE 2

Your Mission is to Build the AI Key Account Manager

Owner: Marvis

Synergy

#Business Application

Problem Statement	How might we leverage AI to intelligently segment, profile, and nurture our most valuable B2B and B2C partners to maximize wallet share and long-term loyalty?		
Description	Imagine this: We have hundreds of dealers – from small hardware stores to giant retail chains. Currently, we treat them all vaguely similar, or rely on a sales manager's memory to decide who gets a factory tour vs. a birthday gift. We need an "AI Relationship Strategist" that automatically sorts accounts (Strategic, Core Profit, Growth), tracks their spending health, and prescribes the perfect nurturing activity (e.g., "Client A is at risk; schedule a dinner") to lock in their loyalty.		
Pain Point	• **Generic Treatment:** We fail to differentiate between a "Strategic Partner" and a "One-Off Buyer," wasting budget on the wrong accounts while neglecting VIPs.	• **Disconnected Loyalty:** Spending data, birthday milestones, and engagement history live in manual Excel tracking, making it impossible to see the full "relationship health."	• **Reactive Engagement:** Sales teams only reach out when an order drops, instead of proactively nurturing partners with planned activities like factory tours or joint events.
Expected Outcome	✓ **Smart Segmentation Engine:** An AI that dynamically profiles every dealer into 3 tiers (Strategic, Profit, Growth) based on real-time spending and potential.	✓ **Automated Nurturing Plan:** A system that suggests specific "treatment packages" (e.g., "Send Birthday Hamper," "Invite for Corp Visit") based on the client's tier.	✓ **Unified Loyalty Tracker:** A dashboard that visualizes the total "Relationship Value“ with annual spend tracked, points earned, and engagement history in one view.
Why This Matters	**It costs much more to get a new customer than to keep an existing one.** This solution transforms our relationships from transactional to strategic, ensuring our best partners feel valued, understood, and permanently loyal to Chin Hin.		

BUSINESS CHALLENGE 3

Your Mission is to Build the Autonomous Credit Scoring Engine

Owner: Pui Kuan

Credit Control

#Productivity

Problem Statement	How might we automate the credit application process by using AI to instantly extract data from CTOS reports and calculate credit scores without human entry?		
Description	Imagine this: A new customer applies for credit. Currently, our credit control team has to open a PDF report (CTOS), manually find specific financial figures, and type them one-by-one into our internal scoring form. It is a slow, repetitive, and error-prone process. We need an "AI Credit Officer" that reads the PDF, intelligently extracts the correct data points (e.g., litigation history, trade reference), and auto-populates the score card for instant decision-making.		
Pain Point	• **Manual Data Drudgery:** Hours were spent to act as "data entry clerks," manually copying numbers from PDFs to credit score form.	• **Human Error Risk:** One typing mistake (e.g., adding an extra zero) can lead to incorrect credit limits and financial risk.	• **Approval Bottlenecks:** Customer onboarding slows down because every application sits in a manual queue waiting for someone to do the data entry.
Expected Outcome	✓ **Smart PDF Extraction:** An AI agent that ingests CTOS reports (PDF) and accurately identifies key fields (e.g., Director Names, Paid Capital, Legal Status).	✓ **Auto-Populated Scorecard:** The system automatically maps the extracted data into the Chin Hin Credit Score formula without human intervention.	✓ **Instant Recommendation:** The engine calculates the final score and suggests an "Approved Limit" or "Reject" status based on our logic.
Why This Matters	By automating the scoring process, we eliminate human error and dramatically speed up customer onboarding, allowing us to say "Yes" to good customers faster than our competitors.		

BUSINESS CHALLENGE 4

Your Mission is to Build the Intelligent Procurement Planning Agent

Owner: Loo

Procurement

#Productivity

Problem Statement	How might we leverage AI to transform manual, spreadsheet-based procurement into an automated, data-driven engine that predicts stock needs and generates purchase orders instantly?		
Description	Imagine this: A procurement officer sits in front of ten different Excel sheets, trying to guess how much kettles to order for next month warehouse sales. It's a high-stakes guessing game. If they order too much, cash is tied up. Too little, and the stock overloads. We need an "AI Supply Chain Brain" that analyzes historical sales, seasonality, and lead times to predict exactly what to order and auto-generates the Purchase Request (PR) for approval.		
Pain Point	• **The "Excel" Trap:** Procurement planning happens offline in disconnected spreadsheets, making the process slow, opaque, and prone to human calculation errors.	• **Inventory Imbalance:** Without smart data, we constantly struggle with either overstocking (wasting cash) or stock-outs (losing sales and delaying projects).	• **Manual Bottlenecks:** Creating and routing Purchase Requests (PRs) manually consumes hours of time that could be spent on strategic supplier negotiations.
Expected Outcome	✓ **Predictive Demand Forecasting:** An AI model that analyzes historical sales velocity and seasonal trends to auto-generate precise procurement plans by SKU.	✓ **Automated PR Engine:** A system that converts the approved plan into a formal Purchase Request and automatically routes it to the correct approver.	✓ **Smart Approver Dashboard:** A "Decision Cockpit" that gives approvers instant context (e.g., "Stock Coverage: 2 days," "Risk: High") to enable faster, safer decisions.
Why This Matters	**Inventory is money sitting on a shelf.** Your solution ensures we buy the right amount at the right time via optimizing our cash flow and ensuring we never run out of stock when our customers need us most.		

BUSINESS CHALLENGE 5

Your Mission is to Enable Seamless User Journey for Employee App

Owner: Alan

Human Resource

#Productivity

Problem Statement	How might we replace complex app menus with an intelligent chat interface that allows employees to execute admin tasks instantly through conversation?		
Description	Imagine this: A Chin Hin employee wants to apply for leave or book a meeting room. Instead of clicking through 10 different menu screens or struggling to find the right button, they should just be able to say, "Book the boardroom for 2pm." We want to transform our employee app from a "clunky tool" into a proactive personal assistant that gets admin done in seconds.		
Pain Point	• **Navigation Fatigue:** Employees waste valuable time digging through deep, confusing menus just to perform simple daily tasks.	• **Disjointed Workflows:** Users have to jump between different modules (e.g., check calendar vs. book room), breaking their flow.	• **Low Adoption:** Complex interfaces frustrate users, causing them to avoid using digital tools altogether.
Expected Outcome	✓ **"One-Shot" Execution:** An AI agent that understands intent and executes actions via API (e.g., "Apply for leave" actually updates the HR system).	✓ **Proactive Nudges:** The system doesn't just wait; it reminds users of tasks (e.g., "Your claim is expiring soon, want to submit it?").	✓ **Zero-Training Interface:** A natural language experience so intuitive that a new hire can use the system on Day 1 without a manual.
Why This Matters	**Happy employees are productive employees.** By removing the friction from admin work, we give our team their time back to focus on high-value innovation rather than clicking buttons.		

BUSINESS CHALLENGE 6

Your Mission is to Build the AI Customer Success Guardian

Owner: Loo

Customer Service

#Business Application

Problem Statement	How might we leverage AI to transform after-sales support from a manual, reactive cost center into an instant, 24/7 intelligent resolution engine?		
Description	Imagine this: A customer's ceiling fan is wobbling. They call support, wait 20 minutes on hold, and then explain the issue to an agent who has to manually type everything into a system. It's frustrating for the customer and exhausting for the agent. We need an "AI Customer Success Guardian" that answers instantly, troubleshoots the technical issue automatically, and logs the case without a human ever touching a keyboard.		
Pain Point	• **The "Admin" Drain:** Agents spend valuable time manually logging calls and typing case notes instead of actually helping customers.	• **Repetitive Fatigue:** Highly skilled staff waste hours answering the same basic FAQs (e.g., "Where is my warranty?") over and over again.	• **Follow-Up Failure:** Without automation, critical cases often fall through the cracks, leading to delayed responses and angry customers.
Expected Outcome	✓ **Omnichannel Auto-Logging:** An AI that listens to calls or reads chats and automatically creates a structured CRM ticket with zero manual entry.	✓ **Instant Resolution Engine:** A troubleshooting bot that guides customers to fix common issues (e.g., "Tighten screw A") instantly, 24/7.	✓ **Sentiment-Based Routing:** A system that detects "angry" tones and immediately escalates those cases to a manager for damage control.
Why This Matters	**Service is the new sales.** A customer who gets their issue fixed in 2 minutes will buy from us forever. This solution protects our brand reputation while freeing our human agents to handle complex, high-value care.		

BUSINESS CHALLENGE 7

Your Mission is to Build the Unified Corporate Helpdesk Agent

Owner: Chris

Shared Service

#Productivity

Problem Statement	How might we replace fragmented support portals with a single AI interface that automates HR & IT answers while seamlessly connecting users to human help when it truly matters?		
Description	Imagine this: An employee needs to know the travel claim limit or report a broken laptop. Currently, they have to search through a messy intranet for the policy or login to a complex portal to log a ticket. We need a "Unified Helpdesk Agent" that acts as the single point of contact which instantly answers questions from our SOPs, automates ticket logging, and intelligently hands off the chat to a live human agent for urgent issues.		
Pain Point	• **The "Search" Fatigue:** Employees waste valuable time digging through hundreds of PDF policies and guidelines just to find a simple answer.	• **Queue Congestion:** Simple queries (e.g., "What is the WiFi password?") clog up the ticketing queue, slowing down resolution for critical issues.	• **Process Friction:** Filing a ticket often requires navigating clunky forms, causing employees to delay reporting issues or make mistakes.
Expected Outcome	✓ **Instant Knowledge Retrieval:** An AI that ingests our entire library of Policies & SOPs to provide accurate, citation-backed answers instantly.	✓ **Conversational Ticketing:** A flow that allows users to raise a formal ticket directly within the chat (e.g., "Raise a ticket for this") without opening a new app.	✓ **Seamless Live Handoff:** A smart trigger that detects complex issues or frustration and instantly transfers the chat to a live human support officer with full context.
Why This Matters	**Employee time is our most valuable asset.** By solving 80% of queries via AI and routing the critical 20% to humans instantly, we create a support experience that is fast, efficient, and empathetic.		

BUSINESS CHALLENGE 8

Your Mission is to Build the Intelligent Document Processing Agent

Owner: Amanda

Project

#Productivity

Problem Statement	How might we leverage AI to transform chaotic document storage into a smart, self-organizing system that prioritizes files based on their actual usage frequency?		
Description	Imagine this: A project manager needs a specific quality report. Currently, they dig through disorganized folders mixed with old, irrelevant files. We need an "AI Archivist" that scans uploaded documents, understands their content, and intelligently sorts them by value and usage frequency via keeping "High Usage" files ready for instant access while seamlessly archiving "Low Usage" records to the background.		
Pain Point	• **The "Search" Struggle:** High-value employees waste hours digging for active documents that are buried under years of "dead" files.	• **Digital Clutter:** Without lifecycle management, our servers are clogged with obsolete data, making retrieval slow and confusing.	• **Compliance Risks:** Critical audit documents are often misfiled or lost in the noise, leading to potential penalties.
Expected Outcome	✓ **Context-Aware Classification:** An AI that reads document text to accurately categorize it (e.g., "This is a Tender") and auto-extracts metadata.	✓ **Smart Frequency Tiering:** A logic engine that auto-tags files as High, Medium, or Low usage, e.g., keeping "Hot" documents in the fastest retrieval tier and moving "Cold" files to deep storage.	✓ **Seamless Retrieval:** A natural language search (e.g., *"Show me the project report from last month"*) that instantly retrieves the right file regardless of its storage tier.
Why This Matters	**Information is only valuable if you can find it fast.** Your solution stops our employees from drowning in data and ensures that the most critical, frequently used documents are always at their fingertips.		

BUSINESS CHALLENGE 9

Your Mission is to Build the AI Pricing Strategist for Maximum Profit

Owner: Loo

Sales

#Business Application

Problem Statement	How might we replace manual pricing guesswork for our channels (traditional, corporate, e-commerce, project) with an AI-driven engine that dynamically recommends the optimal price to maximize margins and sales velocity?		
Description	Imagine this: A sales manager receives a bulk order request from a dealer. To set the price, they rely on intuition and manual Excel calculations, often struggling to balance being competitive vs. protecting our profit margin. We need an "AI Pricing Strategist" that instantly analyzes customer history, stock aging, and market demand to recommend the perfect "Goldilocks" price.		
Pain Point	• **The "Gut-Feel" Gamble:** Pricing decisions rely on manual intuition rather than hard data, leading to inconsistent quotes and lost margins.	• **Slow Decision Cycle:** Gathering the data needed to justify a special price takes hours, causing delays in closing critical deals.	• **Inventory Mismatch:** We struggle to align pricing with stock levels, failing to discount aging stock effectively or holding firm on high-demand items.
Expected Outcome	✓ **Dynamic Pricing Engine:** An AI model that recommends dealer-specific pricing based on purchase history, willingness to pay, and current stock levels.	✓ **Margin Simulator:** A tool that lets sales managers simulate price changes to see the predicted impact on revenue and profit before quoting.	✓ **Smart "Why" Rationale:** The agent doesn't just give a number; it explains the logic (e.g., *"Recommended 5% discount to clear aging inventory"*).
Why This Matters	**Price is our most powerful profit lever.** By moving from "guessing" to "calculating," your solution ensures we stop leaving money on the table and maximize the value of every single deal.		

BUSINESS CHALLENGE 10

Your Mission is to Build the AI Promotion & Rebate Strategist

Owner: Loo

Marketing

#Business Application

Problem Statement	How might we replace reactive, "habit-based" campaign planning with an AI engine that predicts the most effective promotion strategies to maximize Marketing ROI?		
Description	Imagine this: A marketing manager needs to launch a year-end sale. Currently, they often repeat what they did last year, hoping for the best. It's a gamble with the company budget. We need an "AI Promotion Architect" that analyzes historical data, channel performance, and customer behavior to design the perfect rebate structure. It should tell us exactly what discount to offer to drive sales without hurting profits.		
Pain Point	• **The "Rear-View Mirror" Trap:** Promotion decisions are often based on historical habits ("we always do this") rather than predictive data on what will work *now*.	• **The ROI Mystery:** We struggle to accurately measure the true return on ad spend (ROAS) across different channels, leading to wasted budget.	• **Cannibalization Risk:** Poorly designed promotions often just shift sales from one month to another (or one product to another) without generating *new* growth.
Expected Outcome	✓ **Smart Performance Analysis:** An AI that digests years of campaign data to identify exactly which mechanics (rebates, bundles, discounts) drive real uplift.	✓ **Optimized Campaign Recommender:** A system that suggests specific parameters (e.g., "Set rebate at 5% for 2 weeks") to maximize sell-through rates.	✓ **Real-Time ROI Tracker:** A dashboard that monitors active campaigns and flags "ineffective spend" alerts so we can pivot instantly.
Why This Matters	**Marketing budget is an investment, not an expense.** This solution ensures every ringgit we spend delivers maximum impact, shifting our strategy from "spending budget" to "engineering growth."		

BUSINESS CHALLENGE 11

Your Mission is to Build the AI Interior Designer for Smart Living

Owner: Zack

Operations

#Business Application

Problem Statement	How might we use AI to visualize and place the perfect home layout, ensuring every appliance, smart device, and furniture piece is placed for maximum comfort and efficiency?		
Description	Imagine this: A customer buys a new condo but is overwhelmed by the empty space. They don't know where to position their kitchen cabinets, how to optimize airflow for their Elba hood, or where to place sensors for the best smart home connectivity. We need an intelligent AI designer that takes a simple floor plan or photo and automatically suggests the perfect arrangement for aesthetics, workflow, and signal coverage.		
Pain Point	• **The "Blank Canvas" Anxiety:** Homeowners struggle to visualize how products will fit in their actual space, leading to hesitation and delayed purchases.	• **Operational Inefficiency:** Poor placement leads to daily frustrations, like weak WiFi dead zones or a kitchen workflow that just doesn't make sense.	• **Missed "Solution" Sales:** Customers buy single items because they can't visualize how a full package (kitchen + appliances + smart tech) works together.
Expected Outcome	✓ **Instant Layout Generator:** An AI that analyzes a 2D floor plan to auto-generate optimized furniture and appliance arrangements.	✓ **Smart Placement Logic:** The engine suggests locations based on logic (e.g., "Place the router centrally for coverage," "Ensure the hob has ventilation access").	✓ **Visual "Shop the Look":** A feature that lets users visualize Chin Hin products in their specific layout and purchase the entire setup as a bundle.
Why This Matters	**We want to stop selling "products" and start selling "lifestyles."** Your tool gives homeowners the confidence to visualize and buy complete smart home solutions, transforming a stressful renovation into a dream project.		

BUSINESS CHALLENGE 12

Your Mission is to Make Homebuyers Onboarding Journey Effortless

Owner: Amanda

Sales Admin

#Business Application

Problem Statement	How might we transform the stressful, paper-heavy home buying process into a seamless, AI-guided digital journey that feels like a VIP experience?		
Description	Imagine this: A customer just bought their dream home. But instead of celebrating, they are buried in a maze of PDFs, complicated legal compliance, and scattered payment requests. We need an AI Onboarding Agent that holds the buyer's hand through every step, such as proactively collecting documents, tracking payments, and answering "What happens next?" instantly, 24/7.		
Pain Point	• **The "Paperwork Nightmare":** Buyers feel overwhelmed by manual document submissions, often leading to errors and delays in Sale & Purchase Agreement (SPA) signing.	• **Process Anxiety:** Buyers often feel lost in a "black hole," unsure if their payment was received or if their loan is approved.	• **Admin Bottlenecks:** Our sales admin team spends 70% of their time chasing signature and payment instead of delivering high-value customer service.
Expected Outcome	✓ **Conversational AI Interface:** An agent that guides buyers via chat to upload documents and answer FAQs (e.g., "Snap a photo of your SPA to proceed").	✓ **Automated Compliance Engine:** A system that uses OCR (Optical Character Recognition) to instantly verify uploaded docs and trigger e-signatures.	✓ **Real-Time Progress Tracker:** A transparent digital timeline that updates the buyer instantly on every milestone (e.g., "Loan Approved! Next: Sign SPA").
Why This Matters	**Buying a home is the biggest purchase of a person's life.** Your AI agent ensures this milestone is defined by joy, not stress. By automating the boring parts, we build lasting trust and brand loyalty from Day 1.		

THANK YOU
